

# FERTILITY FUNCTIONS

(Source:Petrioli Luciano,"*PRODEMOG 3.0-Demographic software for Windows*", EMMECI-SIENA-ITALY,(2000).

## SLAKENED - REPRODUCTION

**Age-specific fertility rates: Italy, year 1934**

For this function, recently proposed by the author, <sup>(\*)</sup> the distribution of density is such that:

$$f(X) = \sqrt{1 - (X - U)^2 / (V - U)^2} \left[ 1 - e^{-((V-X)^B (X-U)^C) / A} \right]. \quad [1]$$

where U and V represent, respectively, the extreme ages of the studied distribution.

This function is equal to zero for X=U and for X=V.
